The report requires updating with new data and is sent in 48 hours after order is placed.

Air source heat pump electric heater is a device which uses a vapor compression cycle to transfer heat between outdoor air and indoor air or water. There are two type of air source heat pumps including air-to-air heat pumps and air-to-water heat pumps. As the name implies, these systems heat or cool indoor air or move energy into water. An air source heat pump electric heater can provide efficient heating and cooling for your home, especially if you live in a warm climate. When properly installed, an air source heat pump electric heater can deliver one-and-a-half to three times more heat energy to a home than the electrical energy it consumes. This is possible because a heat pump moves heat rather than converting it from a fuel, like in combustion heating systems.

The global Air Source Heat Pump Electric Heaters market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
