The air source heat pump heat exchanger is responsible for exchanging heat between the outside air and the refrigerant. This type of heat exchanger usually adopts a fin-tube design, consisting of a series of aluminum or copper fins and tubes to maximize the surface area to enhance heat transfer efficiency. When the outdoor temperature is low, the heat exchanger works as an evaporator, absorbing heat from the environment and transferring this heat to the room through the refrigerant cycle; when the temperature is high in summer, it acts as a condenser and releases heat to the outside air.
