An air tank for air suspension is a component used in vehicles equipped with air suspension systems. These tanks store compressed air generated by the vehicle's air compressor and serve several important functions:

Air Storage: The primary function of the air tank is to store compressed air. This stored air is used to provide the necessary pressure for inflating air springs or airbags that support the vehicle's suspension system.

Pressure Regulation: Air tanks help regulate air pressure within the suspension system. They maintain a consistent pressure level, ensuring optimal performance and stability of the vehicle's ride height and handling characteristics.

Supply Reserve: The tank acts as a reserve supply of air, ensuring that the suspension system has an adequate air source even when the vehicle's compressor is not actively generating air. This is particularly useful during sudden changes in load or when the vehicle is parked.

The global Air Tank for Air Suspension market size is projected to grow from US\$ 331 million in 2024 to US\$ 585 million in 2030; it is expected to grow at a CAGR of 10.0% from 2024 to 2030.
