The airbag control unit sensor helps to detect collision during the accident. The airbag control unit sensors recognize and measures the seriousness of an accident and after that triggers the proper restraint frameworks. Upward six crash sensors provide the information to the unit. This includes increasing speed sensors and a rotational speed sensor. The readings from these sensors are utilized to measure and look at the signs from the other sensors. The crash signals are then sent to the airbag control unit and new additional system to start the hazard lights & inside lights and turn off the fuel pump and halting the engine.
