The global Aircraft Cabin Air Filters market size is predicted to grow from US\$ 213 million in 2025 to US\$ 257 million in 2031; it is expected to grow at a CAGR of 3.2% from 2025 to 2031.

Aircraft Cabin Air Filters remove dust, allergens and microbes ('microbes' includes viruses and bacteria) from the air recirculated into the cabin and cockpit. This helps to provide a safer, healthier and more comfortable environment for the passengers and crew.

Cabin air cleaners are air filtration systems used in the cabins of civil and commercial aircraft. The main purpose of these filters is to remove airborne pollutants and particles as the air circulates inside the aircraft, ensuring passengers and crew breathe relatively clean air during the flight. Filters capture airborne particles such as dust, pollen, bacteria, viruses, mold, and other microbes. This helps provide a cleaner and healthier flying environment and reduces the risk of passengers contracting illness. Cabin air filters also absorb airborne odors, including tobacco, jet fuel and other odors, for a more comfortable ride. Filters also ensure the circulation and quality of the air inside the aircraft to maintain the right temperature and humidity for a comfortable cabin environment.
