Loosely cross-linked polymers which possess the property of elasticity are called elastomers. The significant property that sets them apart is their ability to recover after deformation in compression or tension. They have a low Young's modulus and high yield strain as compared to other materials. Elastomers are relatively soft and deformable at ambient temperatures owing to their amorphous nature. They can exist above their glass transition temperature, resulting in a possibility of considerable segmental motion. Elastomers can be thermosets (requiring a form of crosslinking called vulcanization) or thermoplastic (called TPE or thermoplastic elastomer). In the aircraft industry, elastomers are majorly used in the form of seals, gaskets, and hoses & tubes for applications such as airframe; propulsion; interior; landing gear, wheels, and brakes; and hydraulic and actuation.
