The HVAC system works by circulating air through the aircraft's cabin and mixing it with fresh air from outside the plane. The air is then filtered to remove contaminants and passed through a heat exchanger to adjust its temperature. The system may also adjust the humidity level by adding or removing moisture from the air.

The HVAC system is controlled by a cabin environmental control system, which includes temperature and humidity sensors, air conditioning units, and a distribution system to direct the air to various parts of the aircraft. Some larger aircraft may have multiple HVAC units to handle different areas of the cabin.

Proper maintenance and monitoring of the HVAC system is crucial to ensure the comfort and safety of passengers and crew. Failure of the HVAC system can result in uncomfortable temperatures, poor air quality, and potentially dangerous conditions such as carbon monoxide buildup.
