Airflow Traverse Probe, in simple terms, is a device used to measure or monitor airflow characteristics within a system or ductwork. It traverses (moves back and forth) across the cross-section of the duct to collect data at various points, providing a comprehensive understanding of the airflow distribution and dynamics within the system. This type of probe is often equipped with sensors that can detect parameters such as velocity, temperature, and pressure, allowing for detailed analysis and optimization of HVAC (Heating, Ventilation, and Air Conditioning) systems or other airflow-related applications. By traversing the duct, it ensures that the measurements taken are representative of the entire flow field, rather than just a single point, thereby enhancing the accuracy and reliability of the airflow assessment.
