The global Airframe Anti-icing System market size is predicted to grow from US\$ 3845 million in 2025 to US\$ 6225 million in 2032; it is expected to grow at a CAGR of 7.3% from 2026 to 2032.

Aircraft anti-icing devices refer to equipment that prevents certain protruding parts of the aircraft from icing or can effectively remove ice when ice forms. Ice on the leading edge of the wing and tail, or on the leading edge of the propeller, the leading edge of the air inlet, and the cockpit windshield can make flight dangerous in serious cases. For example, ice on the leading edge of the wing and tail may change the shape of the wing section, reduce lift, increase drag, and even make flight control difficult and unstable. Ice on other parts will also bring various difficulties. For this reason, anti-icing equipment should be installed in parts that are prone to icing.
