The global Airliner Turboprop Engine market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The airliner turboprop engine is a type of gas turbine engine used as a power source for propeller-driven aircraft used in the airline industry. Unlike a turbojet engine that uses a fan to compress air and uses the jet exhaust for propulsion, a turboprop engine uses a gas turbine to drive a gearbox that powers a propeller to move the aircraft. The turboprop offers better fuel efficiency than a turbojet engine, making it ideal for short- to medium-range flights where speed is not critical.

The market outlook for airliner turboprop engine is expected to remain stable in the coming years because they are a popular choice for regional airlines operating short distance flights. The demand for regional air travel is growing due to increasing urbanization and economic growth in emerging markets. Airlines are looking for fuel-efficient aircraft to satisfy passengers' travel needs at lower operating costs. Airliner turboprop engines provide an attractive solution for this market, offering lower fuel burn, range and load capacity that matches the requirements of regional airlines. Several aviation companies have invested in development projects of highly-efficient and more environmentally friendly turboprop engines that will meet the future regulatory requirements. With technological advancements in aviation, the market outlook of airliner turboprop engines is positive, and there is potential for growth with further innovations in the field.
