The report requires updating with new data and is sent in 48 hours after order is placed.

Airplane tires refer to pneumatic tires used in aviation flight equipment. Such tires require high impact strength and low heat build-up. The rubber materials used in the manufacture of aviation tires must ensure that their performance meets the specified indicators after 24 hours under the harsh conditions of -40°C and 71°C. The burst pressure of the tire is more than 4 times higher than the rated internal pressure. The static charge generated by the tires during take-off and landing of the airplane must be evenly transmitted to the ground.
