An airship airbag, also known as a gasbag, is a specialized component of an airship or dirigible. It serves as a means of containing and controlling the lighter-than-air gas, typically helium, that provides the buoyancy necessary for the aircraft to float in the atmosphere. The airbag is designed to maintain the shape and integrity of the envelope (the outer body) of the airship, ensuring it retains its aerodynamic properties and structural stability. The airbag is typically constructed from a durable and lightweight fabric, which is resistant to gas leakage and capable of withstanding the stresses and strains of flight. It is an essential part of the airship's design, enabling it to achieve controlled flight and maintain its position in the air.
