Abstracts

The global Alcohol-Soluble Quantum Dots market size is predicted to grow from US$ 163 million in 2025 to US$ 283 million in 2032; it is expected to grow at a CAGR of 8.3% from 2026 to 2032.

Alcohol-soluble quantum dots (QDs) are colloidal quantum dots whose surface ligands have been modified to allow them to be stably dispersed in alcohol solvents (such as ethanol, isopropanol, and butanol). Their core is composed of semiconductor nanocrystals, with common materials including CdSe, InP, PbS, and perovskite. Alcohol-soluble systems offer advantages such as low toxicity, volatility, and suitability for inkjet printing. The product is priced at approximately $300 per gram, with global sales of approximately 527 kilograms.

The upstream of the alcohol-soluble quantum dot industry chain includes suppliers of semiconductor precursors (such as Cd, In, and Pb), high-purity alcohol solvents and surface ligands, as well as manufacturers of nanoreactors and dispersion equipment. Downstream sectors include MicroLED and QLED display manufacturers, optoelectronic device developers, and research institutions. This product is rapidly transitioning to cadmium-free, environmentally friendly systems (such as InP and perovskite) and driving deep integration of inkjet printing and patterning processes, while continuous breakthroughs are being made in high-concentration, high-stability alcohol-soluble systems and low-temperature processes for flexible electronics. The overall gross profit margin remained between 35% and 55%, demonstrating strong profitability and potential for technological evolution.

United States market for Alcohol-Soluble Quantum Dots is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
