Thin film deposition refers to the deposition of specific materials on the substrate to form a thin film, so that it has special properties such as optics and electricity. Thin film deposition equipment can be divided into physical vapor deposition (PVD), chemical vapor deposition (CVD) and atomic layer deposition (ALD) equipment according to different process principles, and can be divided into batch type (tube type) and space type according to different equipment forms (plate type) two technical routes. ALD technology is a special vacuum thin film deposition method with high technical barriers. ALD coating equipment can deposit substances on the surface of the substrate layer by layer in the form of monoatomic layers, and each layer of coating is an atomic layer. According to the characteristics of atoms, the thickness of coating 10 times/layer is about 1nm. Due to the self-limiting surface chemical reaction of ALD technology, it has a number of unique film deposition characteristics: 1. Three-dimensional conformality, widely applicable to substrates of different shapes; Pinhole; 3. Sub-nanometer film thickness control can be realized. Based on the above characteristics, ALD technology is widely applicable to thin film deposition in different scenarios, and has good industrialization prospects in many high-tech fields such as photovoltaics, semiconductors, flexible electronics and other new displays, MEMS, catalysis and optical devices. This report studies ALD thin film deposition equipment.
