The global Algae Online Monitoring Platform market size is predicted to grow from US\$ 182 million in 2025 to US\$ 314 million in 2032; it is expected to grow at a CAGR of 8.3% from 2026 to 2032.

An online algae monitoring platform is a digital water ecological management system that uses online algae monitoring instruments as front-end sensing nodes, combining data acquisition, transmission, analysis, and early warning functions. Through continuous collection and intelligent analysis of key indicators such as algal fluorescence, chlorophyll a, and phycocyanin, it achieves real-time monitoring of algal abundance, trends, and outbreak risks in water bodies. This platform typically integrates multi-point monitoring, time-series analysis, threshold early warning, and visualization functions. It can be linked with comprehensive water quality monitoring, water source scheduling, and emergency response systems, and is widely used in drinking water source areas, reservoirs, lakes, river basins, and aquaculture management. It is a core digital support platform for achieving ?early detection, early warning, and early response? to algal risks. Sales volume in 2025 was 410,000 units, with an average price of \$425, total production capacity of 450,000 units, and a gross profit margin of 35%.

As algal bloom risk management shifts from passive response to proactive prevention, single algal monitoring devices are no longer sufficient to meet the management needs of water source safety and watershed governance. Online algal monitoring platforms, by integrating multi-point monitoring data, historical trend analysis, and spatial distribution judgment, provide management departments with continuous and traceable decision-making basis, evolving from an ?auxiliary monitoring tool? into a core digital foundation of the water ecological governance system. Especially in drinking water sources and

important lakes and reservoirs, this platform is gradually becoming deeply integrated with dispatch systems and emergency response procedures, giving it information attributes similar to infrastructure, and market demand shows strong long-term stability.

Currently, the focus of competition in online algal monitoring platforms is shifting from hardware deployment scale to data quality, algorithm capabilities, and system integration levels. Downstream users are paying more attention to the platform's ability to identify algal bloom trends in advance, control false alarm rates, and the fusion effect with multi-source data such as meteorological, hydrological, and water quality data. This trend is driving vendors to upgrade from simply providing monitoring platforms to offering comprehensive solutions that combine monitoring, analysis, early warning, and maintenance services. This is beneficial for generating sustainable service revenue and increasing customer loyalty. As platformization and service integration increase, companies with data accumulation and system maintenance capabilities are more likely to establish a long-term competitive advantage in the industry.
