Algae wafers refer to small circular discs made out of algae biomass harvested from freshwater ponds or saltwater lagoons. These wafer disks serve as a convenient way to deliver essential nutrients, vitamins, minerals, and trace elements directly to herbivorous fishes while reducing waste food contamination in rearing environments. Fisheries professionals place them inside tanks or raceway ponds manually or via automatic dispensers according to feeding schedules tailored to each species' needs based on life stage and water temperature. Incorporating various types of strain-specific algae creates diversified feed menus matching targeted animal preferences and digestibility factors.
