The global Aligning Ball Bearing market size is predicted to grow from US\$ 13762 million in 2025 to US\$ 18784 million in 2032; it is expected to grow at a CAGR of 4.4% from 2026 to 2032.

Global sales of aligning ball bearings reached 1,594 million units in 2025, with an average price of \$8,821 per thousand units.

Aligning ball bearings are double-row ball bearings with spherical outer ring raceways and a curvature center coinciding with the bearing center. They automatically compensate for shaft deflection or installation errors using the spherical outer ring (allowing for a relative tilt of $\pm 3^\circ$ between the inner and outer rings). They primarily bear radial loads but can also withstand small amounts of axial loads.

The main raw material for self-aligning ball bearings is high-carbon chromium bearing steel GCr15. This steel is used for the outer ring, inner ring, and rolling elements. The cage is made from 10# steel sheet (stamped), nylon PA66, or machined copper alloy, depending on the grade. Seals are mostly made of nitrile rubber or fluororubber. The total cost of raw materials accounts for 55-60% of the ex-factory price. In the cost structure, bearing steel bars/tubes account for the largest share, approximately 35-40%, rolling elements and cages combined account for 10-15%, and heat treatment, machining, testing, and labor costs account for approximately 25-30%. Therefore, fluctuations in steel prices have a significant impact on corporate profitability.
