Anaplastic Lymphoma Kinase (ALK) gene, as a tyrosine kinase closely related to tumors, can be activated by translocation or mutation. Abnormal expression such as gene mutation, rearrangement and amplification can activate cell signal transduction in the body. Pathway, which regulates the growth, differentiation and migration of tumors. Tyrosine kinases are kinases that enzymatically catalyze the transfer of gamma phosphate groups from adenosine triphosphate to target proteins. They can catalyze the phosphorylation of protein tyrosine residues on a variety of substrates, and play an important role in cell growth, proliferation, and differentiation. The main oncology indications for tyrosine kinase inhibitors (TKI) include solid tumors and leukemia.
