The alkaline spray tower unit is a type of gas cleaning equipment commonly used in industrial processes for air pollution control and purification. In this system, contaminated gas flows upward through the tower while an alkaline solution (often sodium hydroxide or calcium hydroxide) is sprayed downward as fine droplets. The alkaline liquid reacts with acidic gases such as sulfur dioxide (SO₂), hydrogen chloride (HCl), or other acidic components present in the gas stream to neutralize them, converting them into less harmful compounds that can be easily removed from the scrubbing liquid.

The global Alkaline Spray Tower Units market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
