The global All Solid State Lasers market size is predicted to grow from US\$ 892 million in 2025 to US\$ 1319 million in 2032; it is expected to grow at a CAGR of 5.9% from 2026 to 2032.

An all-solid-state laser is a laser whose pump source and gain medium are both composed of solid-state components. It does not use liquids (such as dyes) or gases (such as flash lamps) as the working medium or pump source. Its core characteristic is the use of a semiconductor laser diode (LD) as the pump source, thus achieving advantages such as high efficiency, high stability, high reliability, and small size. The upstream mainly includes three key components: the excitation system, the laser medium, and the optical resonator. Due to its small size and high reliability, it is widely used downstream in precision machining, scientific research, medical, communications, military, and aerospace fields.

In 2024, global sales reached several thousand units, with prices ranging from \$3,000 to \$50,000 per unit, depending on factors such as power, wavelength, beam quality, and stability. The industry's gross profit margin was between 25% and 40%.

All-solid-state lasers, represented by DPSS, have become the mainstay of the solid-state laser market. In terms of technological development, the industry is evolving towards higher power, higher precision, greater intelligence, and greater integration. Industrial processing remains the largest end-user application, with downstream applications expanding from traditional cutting and welding to new scenarios such as precision processing of new energy battery electrodes and photovoltaic silicon wafers, as well as semiconductor and display manufacturing.

National policies have strongly driven the breadth and depth of laser technology applications in industry. Simultaneously, the trend towards precision manufacturing, the rapid expansion of the aerospace industry, and the accelerated modernization of national defense have collectively created a robust demand for high-performance lasers. The challenges lie in the technological barriers of upstream key materials and devices, the cyclical fluctuations in equipment investment, and the continued pressure from fiber lasers and other all-solid-state technologies to replace traditional DPSS in certain power ranges and applications.
