The global Allyllithium market size is predicted to grow from US\$ 156 million in 2025 to US\$ 243 million in 2032; it is expected to grow at a CAGR of 6.6% from 2026 to 2032.

Allyllithium is a highly reactive organolithium compound with the chemical formula C_3H_5Li , consisting of an allyl group ($CH_2=CH-CH_2-$) bonded to lithium. It is widely used as a strong base, nucleophile, and synthetic intermediate in organic chemistry for carbon-carbon bond formation, pharmaceutical synthesis, agrochemicals, specialty chemicals, and advanced materials production. Industrially, allyllithium is typically manufactured through the reaction of allyl halides (primarily allyl chloride or allyl bromide) with metallic lithium in hydrocarbon or ether solvents under strictly controlled anhydrous and inert conditions. The supply chain begins with upstream raw materials including petrochemical-derived propylene, which is converted into allyl chloride or related allyl compounds, and lithium metal produced from lithium carbonate or lithium chloride. Midstream activities involve organolithium reagent synthesis, purification, packaging, and handling using specialized facilities designed for pyrophoric and moisture-sensitive chemicals. Downstream, allyllithium is consumed by pharmaceutical manufacturers, fine chemical producers, agrochemical companies, contract development and manufacturing organizations (CDMOs), research institutions, and specialty material manufacturers that utilize the reagent in high-value organic synthesis processes. In 2025, global Allyllithium output was about 12,000 tons with 15,000 tons of capacity, average prices of USD 10,000-25,000 per ton, and gross margins around 37%.

United States market for Allyllithium is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Allyllithium is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
