The global Alt-Azimuth Telescope Mount market size is predicted to grow from US\$ 99 million in 2025 to US\$ 129 million in 2031; it is expected to grow at a CAGR of 4.6% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Alt-Azimuth telescope mount is a telescope mounting structure that uses two axes of rotation, horizontal (azimuth) and vertical (altitude), to achieve celestial body tracking and positioning. Its design principle is similar to that of a camera tripod. Users can quickly align the telescope with the target by adjusting the horizontal and vertical angles respectively. Alt-Azimuth mounts are simple in structure, low in cost, and intuitive to operate. They are widely used in entry-level astronomical telescopes, ground-based observation equipment, and some large radio telescope systems. Although complex calculations are required to achieve two-axis coordinated compensation during celestial body tracking (especially in long-term tracking and photography, it is not as efficient as the equatorial type), with the development of automation and computational control technology, modern electric Alt-Azimuth mounts can achieve high-precision tracking and have become one of the important supporting structures for high-performance telescope systems (such as VLT or LSST).

United States market for Alt-Azimuth Telescope Mount is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
