Polishing grade alumina for use in polishing and buffing compounds, abrasives and polishing media. A polishing grade alumina can be applied in various forms, from liquid or solid compounds to slurries or as a dry powder.

Calcined alumina is made by firing a source alumina at various temperatures, depending upon desired level of calcination (burn), into alpha alumina varying from 5 – 100% moving it to its densest and most stable form. The calcined alumina particles appear as crystalline agglomerates which are larger when the degree of calcination is higher. Calcined alumina is generally used in the manufacture of refractories, glass and enamel, tile and porcelains and ceramics.
