The global Alumina Optical Polishing Slurry market size is predicted to grow from US\$ 100 million in 2025 to US\$ 146 million in 2032; it is expected to grow at a CAGR of 4.4% from 2026 to 2032.

In 2025, the global production of alumina optical polishing slurry reached 2,270 tons, with an average selling price of US\$45,000 per ton. The global annual production capacity of alumina optical polishing slurry is approximately 5,000 tons, with a gross profit margin of approximately 23.2%. Alumina optical polishing slurry is an abrasive liquid used for polishing the surfaces of high-precision optical components (such as lenses, prisms, and optical communication components). It typically contains fine alumina particles, a binder or base liquid (such as water or organic solvents), and components such as dispersants, lubricants, and stabilizers. The polishing slurry works by removing surface micro-protrusions through controlled chemical-mechanical action of tiny particles, smoothing the crystal surface, and achieving extremely low surface roughness and excellent optical cleanliness. Its working principle combines chemical softening (promoting localized chemical reactions or softening of the material) and mechanical grinding (micro-cutting of the surface by particles) to achieve high surface quality. During use, it is necessary to control particle size, concentration, temperature, pH value, flowability, and processing time to avoid defects such as scratches, surface damage, or uneven dispersion. The upstream of the alumina optical polishing slurry industry chain includes alumina particles, chemical additives and organic solvents, the midstream is the alumina optical polishing slurry manufacturers, and the downstream is mainly used in industries such as optical lenses, optical instruments and optical equipment.

United States market for Alumina Optical Polishing Slurry is estimated to increase from
