A propeller is a device that turns the rotating power of the engine into propulsive force by rotating the blades in air or water. Two or more blades are connected with the hub. The aluminum alloy blade has been widely used by the advanced blade stress analysis and testing technology. The structure of the propeller is also gradually developed from the constant moment propeller to the hydraulic constant speed variable pitch propeller. The continuous adjustable pitch Angle enables a good balance between the absorption power of the propeller and the output power of the engine, so as to maintain high propeller efficiency in each flight stage.
