The global Aluminium Busbar Trunking System market size is predicted to grow from US\$ 141 million in 2025 to US\$ 170 million in 2031; it is expected to grow at a CAGR of 3.2% from 2025 to 2031.

Electrical Busbar Trunking System is the is a system of distributing electric power using copper or aluminium busbar with suitable enclosures and good amount of protection to prevent the cables from getting damaged due to foreign bodies. The busbar trunking system is a high-current trunk detachable power system, usually composed of a metal casing (iron or aluminum), conductors, insulating materials and related accessories.

Aluminum conductor busway systems are a modern solution for power transmission and distribution. A busway system is a device that transmits power from a power station, substation or distribution station to different areas inside a building, and it can replace traditional cable laying methods to provide more efficient and safer power distribution. Aluminum is an excellent conductive material that can efficiently transmit electricity and reduce transmission losses. The busway system is designed with a large cross-section, which can withstand large current loads and is suitable for high-load power distribution scenarios. The busway system adopts a closed structure, which reduces the risk of electrical fires and also prevents damage to the wires by external objects. The length and branches of the busway system can be customized according to the needs, and it is suitable for various building structures and power layouts. Compared with the traditional cable laying method, the installation of the busway system is faster and easier, reducing construction time and labor costs.
