The global Aluminium Flat Rolled Products market size is predicted to grow from US\$ 107669 million in 2025 to US\$ 140163 million in 2032; it is expected to grow at a CAGR of 3.7% from 2026 to 2032.

Aluminium flat rolled products are aluminium and aluminium alloy sheets, strips, coils and foils produced from ingots, cast coils or hot-rolled slabs through hot rolling, cold rolling, foil rolling, annealing, finishing, surface treatment and slitting processes. They include aluminium sheet, strip, coil, foil, can stock, automotive sheet, aerospace plate, heat exchanger material, lithographic sheet, battery foil and packaging foil. These products are valued for their light weight, corrosion resistance, thermal and electrical conductivity, formability and high recyclability, and are widely used in transportation, packaging, construction, electrical and electronics, aerospace, new energy batteries, appliances, heat exchangers, machinery and consumer goods. In 2025, global Aluminium Flat Rolled Products production reached approximately 28631 K MT.

Demand for aluminium flat rolled products is strongly supported by lightweighting and material substitution across transportation, packaging and industrial applications. Automotive manufacturers increasingly use aluminium sheet and plate to reduce vehicle weight, improve energy efficiency and meet stricter performance requirements, while aerospace and rail transportation continue to rely on high-strength aluminium plate and sheet for structural and interior applications. In packaging, aluminium can stock and foil remain important because they combine barrier performance, formability, recyclability and premium appearance. These end uses create a broad demand base for flat rolled aluminium products across both mature and emerging markets.

The growth of new energy and electrification is also expanding the application scope of

aluminium flat rolled products. Battery foil, battery casing materials, thermal management components, EV structural parts, busbars, heat exchanger materials and lightweight body panels all rely on rolled aluminium products with controlled thickness, surface quality, mechanical properties and cleanliness. As electric vehicles, energy storage systems, power electronics and renewable energy equipment continue to develop, customers are placing higher requirements on alloy design, surface treatment, dimensional tolerance and defect control. This favors producers with advanced rolling mills, clean production environments, strong R&D capability and close cooperation with battery, automotive and electronics customers.

Sustainability and recycling are becoming increasingly important drivers for the aluminium rolling industry. Aluminium can be recycled repeatedly while retaining material value, and many downstream customers are asking for lower-carbon, higher-recycled-content and traceable aluminium products. Flat rolled product manufacturers are therefore investing in recycling systems, closed-loop scrap recovery, low-carbon primary aluminium sourcing, energy efficiency and product certification. At the same time, customers in packaging, automotive, building and consumer goods are moving toward more sustainable material choices, which supports long-term demand for aluminium sheet, coil and foil products that combine performance, recyclability and stable supply.
