The global Aluminum Alloy Electropolishing Solution market size is predicted to grow from US\$ 79.43 million in 2025 to US\$ 115 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

In 2025, global sales volume of aluminum alloy electropolishing solutions is estimated at approximately 14,000 metric tons, with an average market price of around USD 5.8 per kilogram. Pricing varies depending on whether the product is supplied as a ready-to-use bath solution, concentrate, or additive, as well as on the applicable aluminum alloy, chromium-free formulation requirements, and mirror-finishing performance. Gross margins for major manufacturers are estimated at approximately 25%–38%.

Aluminum alloy electropolishing solution is a specialized electrochemical bath used for the precision surface finishing of aluminum and aluminum alloys. During processing, the workpiece serves as the anode and undergoes controlled anodic dissolution under direct current. Microscopic surface peaks, which are exposed to higher current densities, are preferentially removed, thereby reducing surface roughness and improving brightness, smoothness, and cleanliness. The process can also minimize fine burrs, machining marks, and localized surface defects. Compared with chemical polishing solutions that operate without an external electric current, electropolishing provides more controllable material removal and is particularly suitable for aluminum alloy components requiring high surface precision and consistent appearance.

Upstream materials primarily include phosphoric acid, sulfuric acid, organic acids, conductive salts, fluorine-containing or fluorine-free additives, corrosion inhibitors, surfactants, and deionized water. The supporting equipment segment includes acid-resistant tanks, DC power supplies, cathodes, filtration systems, and temperature-

control equipment. Midstream manufacturers are responsible for formulation development, blending, performance testing, and the supply of bath make-up solutions, additives, and replenishers, while also adapting formulations to different aluminum alloy compositions and subsequent surface-treatment requirements. Downstream customers mainly include aluminum component manufacturers and surface-treatment service providers. Electropolishing is typically followed by cleaning, de-smutting, anodizing, electroplating, passivation, or coating, with end-use industries including consumer electronics, automotive components, aerospace, architectural decoration, and home appliances.

United States market for Aluminum Alloy Electropolishing Solution is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Aluminum Alloy Electropolishing Solution is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

Europe market for Aluminum Alloy Electropolishing Solution is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
