The aluminum alloy steam wheel refers to the automobile turbocharger (steam turbine) made of the aluminum alloy material. An automotive turbocharger is a device that increases engine intake pressure and increases air flow by utilizing exhaust gas energy, thereby increasing engine power and efficiency.

The main purpose of the aluminum alloy steam wheel is to reduce the weight of the automobile turbine and improve its heat transfer performance. The aluminum alloy has excellent strength and light weight characteristics, which can reduce the inertial load of the steam wheel and improve its rotational dynamic response capability. In addition, the

aluminum alloy also has good thermal conductivity, which can transfer the heat to the turbine blades faster and improve the working efficiency of the turbine. Aluminum alloy steam wheels have advantages in light weight and thermal conductivity, which can improve the performance and efficiency of automobile engines.
