The global Aluminum Calendering Processing market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The aluminum rolling processing industry is the process of producing various aluminum materials from electrolytic aluminum (mainly aluminum) through various processes and processes such as casting, rolling or extrusion, and surface treatment. According to different processing techniques, aluminum materials can be divided into aluminum rolled materials and aluminum extruded materials, which together account for more than 95% of the output of aluminum processed materials. Among them, aluminum rolled products generally refer to aluminum plates, aluminum strips, aluminum foils, and aluminum extrusions generally refer to aluminum profiles, aluminum wires, aluminum pipes and other products.

The upstream of the aluminum rolling processing industry is the electrolytic aluminum industry, and the downstream application fields are extensive. The aluminum rolling processing industry purchases aluminum ingots from electrolytic aluminum companies to process and produce aluminum sheets, strips and foils. Among them, in the field of transportation, aluminum strips are used to manufacture automotive heat exchangers, automotive body panels, automotive interior and exterior decoration materials, ship decks, aircraft fuselage aluminum panels, and other spare parts panels; thick and thin are used as device materials for vehicles and other transportation tools; lithium batteries The positive current collector belongs to the thickness category of single zero foil and double zero foil, which is called battery foil.
