The global Aluminum Fluoride for Aluminum market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Aluminum fluoride, with the molecular formula AlF_3 , is commonly used in industry as a crystalline hydrate $\text{AlF}_3 \cdot 3\text{H}_2\text{O}$. Aluminum fluoride trihydrate is a colorless triclinic crystal white powder, while anhydrous aluminum fluoride is a large hexagonal crystal with a hexagonal structure and is an ionic crystal. Density 2.88g/cm^3 , melting point 1040°C , boiling point 1291°C ; Insoluble in cold water, soluble in hot water, insoluble in acid and alkali solutions, and insoluble in most organic solvents; There is no reaction when heated with liquid ammonia or concentrated sulfuric acid, or when melted with potassium hydroxide. The chemical properties are very stable, and it does not decompose when heated until it sublimates. Currently, over 95% of industrial aluminum fluoride is used in the aluminum industry as an additive in cryolite alumina solution. It can not only compensate for the loss of alumina in the electrolyte, but also reduce the molecular ratio of the electrolyte, lower the initial crystallization temperature of the electrolyte, and control the thermal balance during aluminum electrolysis. It is an essential raw material for the electrolytic aluminum industry.

United States market for Aluminum Fluoride for Aluminum is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
