The global Aluminum Oxyhydroxide market size is predicted to grow from US\$ 1505 million in 2025 to US\$ 2260 million in 2032; it is expected to grow at a CAGR of 6.0% from 2026 to 2032.

Aluminum oxyhydroxide refers to a group of aluminum oxide hydroxide minerals (commonly including boehmite, diaspore, and related phases) with the general formula $\text{AlO}(\text{OH})$, widely used as a precursor for alumina, catalysts, adsorbents, flame retardants, and advanced ceramics. Its supply chain begins upstream with bauxite mining (the primary aluminum ore), followed by refining via the Bayer process to produce alumina hydrates, which are then further processed (controlled precipitation, hydrothermal synthesis, or calcination/rehydration routes) into specific aluminum oxyhydroxide phases with tailored particle size, surface area, and purity. Midstream activities include purification, milling, surface modification, and classification to meet application-specific requirements (e.g., nano-boehmite for lithium-ion battery separators or high-surface-area grades for catalysts). Downstream, these materials are supplied to industries such as petrochemicals (catalyst supports), electronics (ceramics and coatings), energy storage, flame-retardant fillers in polymers, and environmental applications (adsorbents and water treatment), with distribution handled through both direct manufacturer supply and specialty chemical distributors. In 2025, global Aluminum Oxyhydroxide output was about 2.6 million tons with 3.4 million tons of capacity, average prices of USD 500-1,200 per ton, and gross margins around 24%.

United States market for Aluminum Oxyhydroxide is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
