According to this study, the global Aluminum Rod Continue Casting and Rolling Line market size will reach US\$ 160 million by 2031.

Aluminum Rod Continuous Casting and Rolling Line is an industrial setup designed for the efficient production of aluminum rods through a continuous casting and rolling process. This process involves several key steps:

1. Continuous Casting:

- Melting & Alloying: Aluminum scrap or ingots are melted in a furnace, and alloying elements may be added to produce specific aluminum grades.

#????

- Cooling & Cutting: The solidified bar is cooled down gradually and is then cut to specific lengths, depending on further processing requirements.

2. Rolling Process:

#????

- Rolling Mill: The bars are passed through a series of rolling mills, which progressively reduce the thickness and shape the aluminum into rods or other desired products.

#????

The setup can accommodate various aluminum alloys and product specifications. This method often results in improved material properties, such as better uniformity and fewer defects compared to traditional casting. The continuous process reduces cycle

times and minimizes waste, leading to faster production rates and lower costs. The final output is typically in the form of aluminum rods, which can be used in various applications like electrical conductors, automotive components, and construction materials.
