The global Aluminum Sacrificial Anode market size is predicted to grow from US\$ 1108 million in 2025 to US\$ 1735 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

Aluminum Sacrificial Anode is a type of sacrificial anode made from aluminium or aluminium-based alloys, primarily used in cathodic protection systems to prevent corrosion of metal structures submerged in seawater or buried in soil. Aluminum Sacrificial Anodes are known for their high electrochemical efficiency, lightweight properties, and long service life. They are commonly alloyed with elements such as zinc, indium, or tin to stabilize their electrochemical behavior and improve performance. When connected to a metal surface, the aluminum sacrificial anode corrodes preferentially, thereby protecting the underlying structure (such as ship hulls, offshore platforms, pipelines, storage tanks, and heat exchangers) from electrochemical degradation. Due to their low density and high current output, aluminum sacrificial anodes are especially suitable for large marine and coastal structures. Moreover, aluminium is less toxic and more environmentally friendly compared to other anode materials like zinc or magnesium. The anode gradually dissolves during operation and is eventually replaced, making it a key component in sacrificial cathodic protection systems used across industries such as maritime, oil and gas, power plants, and water treatment.

Drivers of growth: Rising infrastructure spending in developing economies is creating a demand for corrosion protection in pipelines, bridges, and other structures. Growing awareness of the importance of corrosion prevention in industries like oil & gas, marine, and water treatment is also driving the market. Stringent regulations on environmental pollution are leading to the adoption of eco-friendly sacrificial anodes like aluminum,

which are free from harmful metals like mercury. Challenges: Fluctuations in the price of aluminum can impact the cost of aluminum anodes and affect market dynamics. Competition from other sacrificial anode materials like zinc and magnesium can limit market share for aluminum. Development of alternative corrosion protection technologies like impressed current cathodic protection could pose a challenge in the long run.
