Aluminum is one of the most common metals in the world. Aluminum is a silvery-white, metallic material. It is light, malleable, ductile, and non-magnetic under normal conditions. It has a density of 2.7 g/cc, a melting point of 660°C, and a vapor pressure of 10<sup>-4</sup> Torr at 1,010°C. Although it is not a strong material, it is a good conductor of heat and electricity and is able to form an oxide layer that is resistant to corrosion. Due to its high reactivity, it is rarely found in nature as a free element.

Sputtering is the process of forming a thin film when the object is attached to the target substrate by the sputtering and scattering, and the sputtering target is the material for

high-speed particle bombardment. High-purity aluminum targets are target material products that meet the technical requirements of high-purity aluminum targets and are prepared using high-purity aluminum ingots as raw materials and using processing methods such as forging, hot rolling, and cold rolling. In this report, we counted aluminum sputtering target for semiconductor.

In the global market, the core manufacturers of Aluminum Sputtering Target for Semiconductor are mainly companies such as Linde, Sumitomo Chemical, and Konfoong Materials? ect. The top five companies in the industry account for about 80% of the market share.
