## Abstracts

The global Ambulatory Surgical Center Software market size is predicted to grow from US\$ 2007 million in 2025 to US\$ 3148 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

The Ambulatory Surgical Center Software is an integrated information management system designed specifically for outpatient medical institutions (such as independent day surgery centers, hospital-affiliated outpatient surgery departments, and specialist clinics) that perform day surgery, minimally invasive surgery, and specialized surgical procedures.

The development of ambulatory surgical center software is primarily driven by national policies promoting day surgery and tiered medical services, the requirements of medical insurance payment reform for refined operational management, the growing demand from patients for efficient and safe surgical services, and the intrinsic motivation of medical institutions to improve surgical efficiency, ensure medical quality, and control operating costs. With the improvement of primary and county-level medical capabilities, a large number of outpatient surgical centers are being built at an accelerated pace, urgently requiring professional information systems to support the entire process management from preoperative assessment and surgical scheduling to postoperative follow-up. Simultaneously, pressures such as optimizing surgical resources, supervising the use of consumables, and calculating disease-specific costs are further driving institutions to adopt digital tools to achieve standardized, traceable, and highly efficient surgical service models.
