An ammonia dissociator is a device used in industrial processes to separate ammonia (NH<sub>3</sub>) into its constituent elements, nitrogen (N<sub>2</sub>) and hydrogen (H<sub>2</sub>). This process is often referred to as ammonia decomposition or dissociation. The dissociator typically operates at high temperatures to break the chemical bonds within the ammonia molecule, producing nitrogen and hydrogen gases. The dissociation of ammonia is an endothermic reaction, meaning it requires energy input in the form of heat to proceed. Therefore, ammonia dissociators are often heated using electric heaters, combustion systems, or other heat sources to reach the required temperatures for efficient dissociation.

The global Ammonia Dissociator market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
