The global Ammonia from Coal market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

After the raw coal is pulverized, it is sent to the gasifier for gasification to make gas containing H₂ and CO. Then, various purification methods are used to remove dust, H₂S, organic sulfides, CO, and CO₂ in the gas. and other harmful impurities to obtain a clean 1:3 nitrogen-hydrogen mixture that meets the requirements of ammonia synthesis. Finally, the nitrogen-hydrogen mixture is compressed to above 15Mpa to synthesize ammonia with the help of a catalyst. The process steps can be roughly divided into several parts: gas generation, purification, conversion, and ammonia synthesis.

The market share of coal-to-synthetic ammonia in the entire synthetic ammonia industry is decreasing year by year.
