Amorphous Metal Ribbon is a new soft magnetic material. It is produced through the advanced technology of rapid solidification of molten metal at a cooling rate of about a million $^{\circ}\text{C}/\text{sec}$. During this process the metal is rapidly quenched as a form of ribbon with 25-35 μm thickness, and the micro-structure of the alloy is the amorphous due to the high quenching rate. Amorphous Metal Ribbon has many advantages, such as high permeability, high saturate induction, high electrical resistivity, high density, low core loss and good stability. It can replace the materials of silicon steel, permalloy and ferrite. It is widely used in electronics products that high accuracy and good stability are the most required.

The global Amorphous Metal Ribbons market size is projected to grow from US\$ 437 million in 2024 to US\$ 693 million in 2030; it is expected to grow at a CAGR of 8.0% from 2024 to 2030.
