The global Amorphous Silica-Alumina (ASA) Catalyst market size is predicted to grow from US\$ 246 million in 2025 to US\$ 381 million in 2032; it is expected to grow at a CAGR of 6.5% from 2026 to 2032.

In 2025, sales of amorphous silica-alumina (ASA) catalysts reached 4,539 tons, with an average price of US\$55,352 per ton.

Amorphous silica-alumina (ASA) catalysts are solid acid catalysts composed of SiO_2 and Al_2O_3 uniformly composited at the molecular scale, maintaining an amorphous structure (no crystalline peaks in XRD). Their surface simultaneously possesses Brønsted acid sites (BAS) and Lewis acid sites (LAS), and the acid density and strength can be controlled by parameters such as the Si/Al ratio, calcination temperature, and hydrothermal treatment. Due to their large pore size and high specific surface area (200–600 m^2/g), they are widely used in heavy oil catalytic cracking (FCC), olefin oligomerization, biomass aromatization, alkyl transfer, and hydrocracking reactions, acting as an 'acid support' or 'bifunctional acid.'

Industrial-grade ASA uses silica sol (or water glass) and sodium aluminate/aluminum sulfate as co-precipitation precursors. The process involves acid-alkali co-flow precipitation, aging, filtration, drying, and calcination at 600 °C before shaping. In terms of raw material costs, water glass accounts for 35–40%, aluminum sulfate for 20–25%, acid (H_2SO_4) and alkali (NaOH) for 10%, energy consumption (drying + calcination) for 15%, and labor and environmental treatment for 10–15%.

United States market for Amorphous Silica-Alumina (ASA) Catalyst is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026

through 2032.
