Amphimobile fungicide is a type of systemic fungicide that can be conducted simultaneously through the xylem and phloem in the plant body, and has the ability to conduct upward (acropetal) and downward (basipetal). After being applied to the plant body, this fungicide can be transported from the roots to the leaves, and can also be conducted from the leaves to the roots or other organs, ensuring that the entire plant can obtain protection or treatment effects. Due to its wide conductivity and strong systemicity, amphimobile fungicide has significant advantages in preventing and controlling systemic fungal diseases of plants, and is especially suitable for agricultural and horticultural scenarios that require protection of the entire plant or protection of new tissues. Common representatives include some new systemic fungicides such as oxathiapiprolin.
