Amplitude type spatial light modulator is an optical device used to modulate the amplitude distribution of light. It is an optical device that can achieve spatial modulation, which can adjust the intensity or amplitude of light based on the input electrical signal, thereby achieving spatial modulation and control of light. Amplitude type spatial light

modulator is usually based on liquid crystal technology or Photoelectric effect. The liquid crystal amplitude type spatial light modulator uses liquid crystal materials to modulate the amplitude of light by adjusting the electric field applied to the liquid crystal layer, changing the transmittance or reflectivity of light passing through the liquid crystal layer. The photoelectric amplitude type spatial light modulator uses the Photoelectric effect to control the light intensity by applying an electric field or changing the voltage. Amplitude type spatial light modulators can modulate the amplitude of light in space as needed, thereby achieving applications such as image transformation, beam modulation, and optical information processing. It is commonly used in fields such as optical communication, optical display, optical imaging, optical detection, and interferometry. In optical communication, amplitude type spatial light modulators can be used for modulation and amplitude modulation of optical signals, achieving data transmission and optical modulation operations in optical communication systems. In the field of optical displays, amplitude based spatial light modulators can be used in displays and projectors to achieve high contrast and dynamic range image display. In addition, amplitude type spatial light modulators can also be applied in fields such as optical imaging systems, optical detection systems, and interferometry, providing optical modulation and control capabilities with high spatial resolution, wide modulation range, and fast response.
