Amyloid Peptides?Amyloid beta or Abeta) denotes peptides of 36–43 amino acids that are crucially involved in Alzheimer's disease as the main component of the amyloid plaques found in the brains of Alzheimer patients. The peptides derive from the amyloid precursor protein (APP), which is cleaved by beta secretase and gamma secretase to yield A?. A? molecules can aggregate to form flexible soluble oligomers which may exist in several forms.

There has been a growing emphasis on biomarker research and the development of diagnostic tools for the early detection and monitoring of amyloid-related diseases, driving the demand for sensitive and specific assays capable of detecting and quantifying amyloid peptides in biological samples, facilitating early intervention and personalized treatment approaches.
