X-ray film has a certain performance characteristics, the parameters of which should be taken into account when setting the exposure conditions and the proper degree of film utilization. Sensitometric properties of light-sensitive materials are determined by the characteristic curve, i.e. the graph of function of the optical density over the logarithm of exposure, where the exposure (E or H) is the product of illuminance (I) and exposure time (t), and the optical density is the logarithm of the quotient of incident light intensity to light intensity transmitted through the exposed X-ray film. Photosensitive material does not react in areas of low exposure, and the obtained optical density results from optical density of a base material coated with photosensitive layers (Dp), and from optical density of fog (D0), which added all together, constitutes the minimum optical

density (D_{min}). With a certain value of exposure, the value of optical density starts increasing slowly and converts into the linear dependency with a specific angle of inclination.

Pet medical care is the second largest segment in pet industry. In the UK, annual spending on veterinary and other pet services has risen from ?2.6bn in 2015 to ?4bn in 2021, a 54% increase in just six years.
