Analytical flow cytometers consist of a fluidic system for cell processing and an optical system including a signal detector and processor for data acquisition. Instruments designed for FACS also contain a cell sorting component that directs cells into different capture vessels. The fluidic system is designed to generate a uniform flow of single cells to ensure proper analysis when the cells are illuminated by the light source used for

detection. Mainly used in the determination of cell population ratio, phenotype determination, cytokine detection, cell proliferation/apoptosis detection, cell cycle detection, cell killing ability detection, cell phagocytosis function detection, etc.
