Anesthesia circuits are utilized for a variety of diagnostic and therapeutic surgical procedures to deliver anesthetic agents and oxygen. The device serves as an interface between the anesthesia machine and the patient. Surgical procedures vary from cardiovascular, orthopedic, nervous system, digestive system, urinary system, to ear, nose, throat and cancer related operations. Non-surgical procedures include pain relief and stabilization, organ support, ventilation during resuscitation and continuous ventilation for patients in critical care. The subsegments covered in this model are Rebreathing Circuits and Non-Rebreathing Circuits. With rebreathing circuits, the flow of gas through the circuit is circular where carbon dioxide is absorbed and the patient can rebreathe the expired gases. Non-rebreathing circuits use high gas flows to remove the expired carbon dioxide from the circuit before the patient begins to inspire.
