The global Angle Beam Transducer market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

An angle beam transducer is a device that converts one form of energy into another form of energy at an angle to the incident energy. It is commonly used for ultrasonic testing, emitting and receiving ultrasonic waves at specific angles, which is useful for detecting sub-surface defects in materials. The transducer consists of a piezoelectric crystal or magnetostrictive material that vibrates when an electric current is present, producing ultrasonic waves that travel through the material being measured. By adjusting the angle of the transducer, the depth and location of defects can be determined more precisely.

United States market for Angle Beam Transducer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
