Anhydrous aluminum chloride is an inorganic chemical compound that does not contain water molecules. It is a grayish-white or yellowish crystalline compound with a characteristic odor. It is used as a powerful Lewis acid catalyst in several chemical reactions, mainly in Friedel-Crafts alkylations and Friedel-Crafts acylations. Anhydrous aluminum chloride occurs in two forms: granule and powder.

The granule form segment is the fastest-growing segment of the anhydrous aluminum chloride market. The high demand for granular anhydrous aluminum chloride is primarily driven by its characteristics, such as excellent flow properties, particle size uniformity, small surface area, and increased compressibility.
