Anhydrous lanolin (EP-ELP) is a high-purity, multi-stage refined natural lanolin that meets European Pharmacopoeia (EP) standards and has been specifically optimized for pharmaceutical and high-end cosmetic applications in terms of color, odor, and impurity levels. It is an excellent emollient and emulsifier, commonly used in skin creams, ointments, lipsticks, and other products. It has high water absorption, deeply moisturizes, repairs the skin barrier, and is gentle and biodegradable.

Upstream, it is directly linked to livestock resources, using crude lanolin obtained during the raw wool washing process as its core raw material. This is a natural and renewable resource, and its quality is significantly affected by sheep breed, origin environment, and washing processes. Midstream is the refining and processing stage, where manufacturers use advanced processes such as multi-stage refining, decolorization, deodorization, and molecular distillation to purify crude lanolin into a low-allergenic product that meets European Pharmacopoeia standards, particularly with total pesticide residues not exceeding 1.0 ppm.

Global sales are projected to reach approximately 20,000 tons in 2025, with an average selling price of US\$13/kg. The industry's gross profit margin is between 25% and 30%.
