Animal autoimmune diseases are the result of specific immune responses and directed against self. Animals have the ability to control immune aggression. It acquired the capacity to avoid self-reaction called as tolerance, which allows removal of antigenic pathogens in the absence of self-recognition. Sometimes, autoimmune cells will get activated due to molecular imitation between pathological antigens and self. Animal autoimmune diseases mostly arise from prolonged sustained immune responses against self. This mechanism is responsible for the breakdown of animal autoimmune tolerance. Animal autoimmune diseases mainly induced by triggering lymphocytes. In some cases because of autoimmune diseases, the animal loses complete or part of the targeted tissue. In other cases, animal tissues are damaged chronically by an

autoimmune reaction, which results in inhibition of the tissue. Once if the autoimmune reaction started, it leads to the impairment of the targeted tissue. The reasons for animal autoimmune diseases are obscure; it appears that malfunction occurs in recognition, whereas animal body fails to differentiate foreign and self. Trauma, viral infections, and vaccination are most common reasons for autoimmune diseases in animals. Most common type of autoimmune diseases in animals are systemic lupus erythematosus, autoimmune myasthenia gravis, autoimmune hemolytic anemia, diabetes mellitus, and thrombocytopenia. Treatment mainly includes conventional steroids at high doses.
